TEST REPORT

Rendered to:

CARTER ARCHITECTURAL PANELS INC.
221 E. Willis Street "A" Unit 18
Chandler, AZ 85286

Report No.: CAP101920-47
Test Date: 08/18/2020
Report Date: 10/21/2020

1.0 General Information

1.1 Product

Heatlok HFO Pro Spray Foam Insulation (Closed-Cell)
IFTI DC-315 Intumescent Coating
Sher-Cryl HPA Acrylic Coating
3MM EVOPlate coil coated 5052-H32 solid plate
Fusion "Drill Free" MCM Panel attachment system

1.2 Project Summary

ICC NTA, LLC was contracted by HUNTSMAN BUILDING SOLUTIONS (DEMILEC (USA) INC.) to evaluate *Heatlok HFO Pro Spray Foam Insulation (Closed-Cell)*, within the wall assembly containing the components listed in **1.1 Product**, in accordance with NFPA 285. Results obtained are tested values and were secured by using the designated test method(s). Testing was conducted at ICC NTA's facility in Bryan, TX.

1.3 Product Description

The wall assembly was constructed with 3-5/8" deep, 20-gauge steel stud framing spaced at 24" On-Center. The studs were fastened to equivalent track using ½" pan head, self-drilling framing screws.

Exterior sheathing consisted of 5/8" thick USG SECUROCK Ultralight glass mat sheathing gypsum wallboard secured to the studs with #6 - 1-1/4" bugle head, self-tapping drywall screws. Fastener spacing was 8" O.C around the perimeter and 12" O.C. in the field. Joints were oriented vertically. No joint compound was used on seams or screw heads.

The interior sheathing consisted of 5/8" thick USG Type X gypsum wallboard fastened to framing with #6 1-1/4" bugle head, self-tapping drywall screws. Fasteners were spaced 8" O.C. around the perimeter and 12" O.C. in the field. Joints were oriented vertically and covered with paper joint tape and USG All-Purpose joint compound. All screw heads were covered with joint compound.

The Heatlok HFO Pro Spray Foam Insulation (Closed-Cell) was applied to the inside of the exterior sheathing in between the steel studs at a nominal thickness of 2-1/4".

The Heatlok HFO Pro Spray Foam Insulation (Closed-Cell) was applied on the outside of the exterior sheathing at a nominal thickness of 3-3/4" in between the steel Z-girts.

The exterior spray foam was coated with 18 mils WFT of International Fireproof Technology Inc. DC-315. A volume of 2.9 gallons of coating was applied to 252 sq. ft of wall area, resulting in a theoretical application rate of 87 sq. ft./ gallon. On a 100 sq. ft. basis, this equates to $(100/87) = 1.15$ gallons. The theoretical wet mil for liquids is 16 mil/gallon, or in this case $1.15 \times 16 = 18.39$ wet mils. The reported volume solids percentage from the manufacturer is 67.1%. The theoretical dry film thickness was $18.39 \times 0.671 = 12.34$ mils. An additional 9 mils WFT with a theoretical application rate of 168 sq. ft/gallon of Sherwin-Williams Sher-Cryl HPA was applied over the dried intumescent coating per design specifications provided by the client. On a 100 sq. ft. basis, this equates to 0.60 gallons. In this case, the theoretical wet film thickness of the topcoat was 9.52 mils. The reported volume solid percentage of 33%, provided by the manufacturer, the topcoat theoretical dry film thickness was 6.39 mils. The DC-315 and Sherwin Williams Sher-Cryl HPA arrived at the facility on 07/24/2020.

Carter Architectural Panels Inc. contracted their approved fabricator, Pro-Line Panel Systems, LLC to install horizontal Z-girts – 4" depth, 2" legs, 18 ga. steel fastened through the exterior sheathing and 4" deep, 1-1/2" leg, 18 ga. steel C-channel installed around the perimeter of the window opening, with one leg fastened through the exterior sheathing. 3mm EVOPlate 5052-H32, coil coated solid aluminum panels, sourced through Architectural Systems Group, LLC, were installed over the exterior spray foam using the patent Fusion "Drill Free" attachment system by Carter Architectural Panels Inc. Cladding joints were closed with 3MM spline material concealing fasteners so that all panel edges were finished upon completion of installation. Design specifications can be found in **Appendix C - Drawings**.

A window opening was installed 30" above the top of the concrete slab of the first-story test room according to the standard. The final window opening dimensions were 78" wide by 30" tall. The perimeter of the window was covered with 26 ga. aluminum sill flashing, installed by Proline Panel Systems, LLC. Flashing was 11-1/2" deep overlapping exterior of wall by approximately 3-15/16". The flashing was attached to the C-channel using self-tapping screws spaced approximately 15" O.C. The flashing edge protruded beyond the exterior wall approximately 15/16".

Nominal 4 pcf, 4" thick Owens Corning Thermafiber Safing insulation installed within the stud cavity at floor line locations filling the full depth of the stud cavity. Mineral wool safing installed at a 4 in. depth flush with the bottom surface of the floor line. Thermafiber safing was supplied by ICC NTA, LLC.

1.4 Qualifications

ICC NTA in Bryan, TX has demonstrated compliance with ISO/IEC 17025 and is consequently accredited as a Testing Laboratory. ICC NTA is accredited to perform all testing reported herein.

1.5 Product Sampling

Heatlok HFO Pro and A-PMDI ISO were sampled by Intertek B&C personnel for the testing reported herein. The specimen(s) were witnessed during production and tagged prior to shipment, (Reference Intertek B&C Test Specimen Selection Report No. L2062.01-801-47, dated 07/13/2020). All test specimens were supplied by CARTER ARCHITECTURAL PANELS INC.. Specimen arrived at ICC NTA, LLC Southwest facility on 07/21/2020.

DC-315 was sampled by QAI Laboratories personnel for the testing reported herein. The specimen(s) were witnessed during production and tagged prior to shipment, (Reference QAI Laboratories Job No. TJ7162-ENG, dated 08/19/2020). The production of DC-315 took place on 06/23/2020. The test specimen was distributed into eighteen 5-gallon buckets after witnessing. Test specimens were supplied by International Carbide Technology Co. Ltd. Specimen arrived at ICC NTA, LLC Southwest facility on 07/24/2020.)

1.6 Witnessing

Tony Sauceda of Huntsman Building Solutions (Demilec (USA) Inc.) was present for testing reported herein. Brad Glazier of International Fireproof Technology Inc. was present via video conference calling systems.

1.7 Conditions of Testing

Unless otherwise indicated, all testing reported herein was conducted in ambient laboratory conditions.

2.0 Referenced Standards

NFPA 285-19 – Standard Fire Test Method for Evaluation of Fire Propagation Characteristics of Exterior Wall Assemblies Containing Combustible Components

3.0 Summary of Results

Limits of Flame Propagation (Exterior): **Passed**
Temperatures at 10 feet (Exterior) < 1000° F: **Passed**
Flames in Second-Story Test Room: **Passed**

Temperatures 1 in. away from wall (Second-Story Test Room) < 500°F above ambient temperature: **Passed**
Temperatures of Combustible Materials < 1000° F (Wall Cavity air space) TCs 28, 31-40: **Passed**
Temperatures of Combustible Materials < 750°F (Wall Cavity and Stud Cavity) TCs 55-65 and 68-79: **Passed**

4.0 Test Method

The wall assembly was evaluated in accordance with the following:

- **NFPA 285 – Standard Fire Test Method for Evaluation of Fire Propagation Characteristics of Exterior Wall Assemblies Containing Combustible Components**

4.1 General

Purpose

The purpose of this test is to provide a standardized test procedure in order to determine the suitability of exterior wall assemblies and panels utilized as components of curtain wall assemblies. These wall assemblies are constructed using combustible materials or that contain combustible elements for installation on buildings.

Fire testing is conducted in order to evaluate the fire propagation characteristics of exterior wall assemblies and panels used as components in building assemblies. Visual observations and data acquisition of temperatures are utilized in this

test method to assess the wall assemblies ability to resist flame propagation over the exterior face of the test specimen, ability to resist the vertical flame propagation within the combustible components from one story to the next, ability to resist flame propagation on the interior face of the wall from one story to the next, and the ability of the wall assembly to resist lateral flame propagation from the compartment of flame origin to adjacent combustible compartment spaces.

4.2 Test Apparatus

The test apparatus is a two-story structure having a height of 15 ft. 8 in. with a test room on each story constructed of 8 in. nominal concrete block. Each test room has an unfinished inside dimension of 10 ft. wide by 10 ft. deep and an unfinished inside height of 7 ft. The test apparatus was constructed in accordance with the standard. The interior walls and ceiling of the first-story test room are protected with one-layer of 5/8 in. thick Type X gypsum wallboard and one layer of nominal 1-1/2 in. thick, nominal 8lb/ft³ density ceramic fiber insulation. The first-story slab is insulated using two layers of nominal 5/8 in. thick gypsum wallboard.

The first-story test room burner is constructed of nominal 2 in. outside diameter steel pipe with nominal 18 in. diameter holes spaced a nominal 1 in. on-center. The burner holes are located on the top surface of the pipe. The first hole on each side of the room burner is located 3-1/2 ft. from the rear window and continued around the front face of the burner. The pipe is wrapped with a single layer of nominal 8 lb./ft.³ density ceramic fiber blanket. The centerline of the burner is positioned 2-1/2 ft. above the floor surface of the test room.

The window burner is a 60 in. length of 2 in. outside diameter steel pipe with a ½ in. wide by 44 in. long slot. The burner is wrapped in nominal 8 lb./ft.³ density ceramic fiber blanket. The burner is mounted to a movable trolley in order to position the burner in the center of the window opening. The burner's horizontal centerline is positioned 9 in. below the bottom surface of the window header. The vertical centerline of the burner is positioned within 0-5 in. from the wall assembly based on the calibration procedure.

4.3 Test Specimens

The core components of the test assembly were provided by ICC NTA, LLC. The gypsum wallboard and steel studs arrived at the testing facility on April 3, 2020. The wall was assembled on April 27, 2020. The Denseglass arrived at the facility on July 6th, 2020. The Heatlok HFO Pro Spray Foam (Closed-Cell), provided by the client, arrived at the facility on July 21st, 2020. For product sampling see **Section 1.5, Product Sampling**.

A representative test specimen was constructed and built under representative conditions of those applied in the field during construction in order to assess the materials, workmanship, and details such as dimensions of parts and all components in the assembly. ICC NTA, LLC personnel constructed a 14' 1-1/2" × 18' 2" wall with the window opening. The wall assembly composed of the 20-gauge steel studs and 5/8" thick USG SecureRock Denseglass wallboard was completed prior to the installation of the SPF. The 5/8" thick USG Type X gypsum wallboard was installed after stud cavity SPF was installed.

4.4 Calibration Summary

ICC NTA, LLC conducted an ISMA calibration on June 11, 2020 with the gas flow rates shown below. Both burners used natural gas. Burner gas flow rates were adjusted accordingly in order to achieve the required temperatures and heat flux as specified within the standard.

Burner Fuel Flow		
Time (min)	Room Burner (CFM)	Window Burner (CFM)
0 - 5	31	0
5 - 10	38	7
10 - 15	45	11
15 - 20	48	14
20 - 25	48	16
25 - 30	50	20

Note: Window Burner - 3" from Wall

	Actual	4.1	4.7	3.7

4.5 Test Setup and Procedure

The product(s) were setup and evaluated in accordance with the most current version of NFPA 285.

The wall assembly was assembled and fastened to a movable test frame. The test frame with test specimen were placed in front of the test apparatus and secured using ratchet straps. The window burner was set in position at 3" away from the wall and 9" below the top of the window header. Testing was conducted at ICC NTA, Inc. Southwest Laboratory. The thermocouple leads were connected to the data acquisition system in the control room and the connection was verified prior to ignition. The ambient air temperature within the lab was 86.5°F, with a relative humidity of 55.1%

Deviations from the standard include: Thermocouple placement in first story ceiling. Deviations can be found in **Appendix C – Drawings on Drawing No. 3**.

4.6 Test Results

At 10:12 AM, the burners were ignited, and the gas flow rates for each burner were controlled following the predetermined setpoints for a period of 30 minutes.

First-Story Test Observations	
0:00	Room Burner Ignited, Test Started
2:13	Flames Exiting the window opening
3:00	Interior sheetrock paper beginning to burn/fall, smoke emitting from right side
5:00	Window Burner Ignited
6:30	Discoloration developing at top corners of window header on ext. panels
9:05	Slight off-gassing emitting at second-story floor line, Flame height at 2 ft.
9:54	Increased off-gassing at top left corner of wall
10:49	Flame height at 3 ft., slight discoloration at horizontal joint
11:53	Scorch mark at 2 ft above window on right panel
12:14	Panel discoloration increasing to 4 ft above window
12:20	Scorch mark growing to approximately 8 in. in diameter
12:41	Top right corner of wall is beginning to offgas
12:48	Panel coating at scorch mark has burned away
13:54	Discoloration on panels upwards to 7 ft. Scorch spot-on right-side panel growing to 1.5 ft in diameter
14:25	Scorch spot developing on left side paneling at 2 ft
15:50	Paneling at 3 ft level beginning to warp
16:00	Scorch spot developing on second right-side panel at 3 ft level.
16:55	Scorching of ext. cladding drifting to left side of second panel at 3 ft
17:12	Increased off-gassing from top left corner of wall
17:30	Window header flashing opened, flames developing from b/w header and stud track
18:46	Header still intact, Right side paneling at 4 ft beginning to warp
19:30	Increased off-gassing, increased warping at bottoms of panels at 3 ft
20:24	Flames at 4 ft above window opening, intermittent at 5 ft
20:29	Flames emitting from behind flashing on window jambs
22:30	Increased off-gassing across the entire top of the wall, increased warping in panels, scorch of paneling has reached 6 ft
23:25	Paneling at 2 ft, center above the window has melted away and flames are emitting from hole in cladding
24:30	Cladding paint has burned away at 7 ft above window
26:50	Aluminum cladding on window header melting away
27:03	Cladding scorch has reached 8 ft above window
27:07	Flames at 5 ft above window, intermittent at 6 ft.

27:36	Increased flame growth stemming from wall where paneling melted away at 2 ft
28:50	Popping can be heard across the ext. wall
30:00	Test Completed, Final flame height of 5 – 5.5 ft. Intermittent at 6 ft

Post Test Observations	
30:02	Continuation of flaming at 2 ft where cladding melted away
30:04	Technician pre-maturely extinguishing flames
30:16	SPF reignites, flaming continuance along window perimeter
31:03	Scorch spot developing at 2 ft above the window on the left panel from within the wall
34:09	Flame at center of wall beginning to self-extinguish
37:00	Flames self-extinguish
40:00	Post-Test Observations completed

Second-Story Test Room Observations	
2:09	Smoking beginning to enter on the left side of the wall
2:51	Smoke entering the room in the center at the floor line
5:49	Increased smoke emitting from the second story floor line
7:56	Smoke beginning to collect in the room
11:35	Increased smoke build-up in the room
16:00	More dense smoke filling the room
19:45	Limited visibility in room
22:35	Limited to no visibility in room
24:00	Increased amount of smoke
26:00	No visibility in second story room
27:00	No change in volume, darker smoke
28:00	No change
30:00	End of Test

Tabular and graphical data can be found in Appendix A.

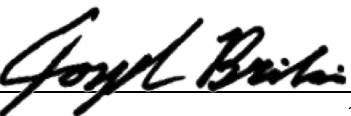

4.7 Summary and Conclusions

The wall assembly as described in this report met the Conditions of Acceptance of NFPA 285-2019 when exposed to the gas flow rates of the window and room burners.

5.0 Closing Statement

This report contains only findings and results arrived at after employing the specific test procedures listed herein. It does not constitute a recommendation for, endorsement of, or certification of the product or material tested. ICC NTA, LLC makes no warranty, expressed or implied, except that the test has been performed, and a report prepared, based upon the specimen specified by the client. Extrapolation of data, from the test data provided herein, to the batch or lot from which the specimens were obtained may not correlate and should be interpreted with extreme caution. ICC NTA assumes no responsibility for variations in quality, composition, appearance, performance, or other features of similar materials produced by the client, other persons, or under conditions over which ICC NTA has no control. ICC NTA has issued this report for the exclusive use of the client to whom it is addressed. Any use or duplication of this report shall not be made without their consent. This report shall only be reproduced in its entirety.

Appendix C – Drawings

The test specimen drawings which follow have been reviewed by ICC NTA, LLC and are representative of the test specimen(s) reported herein. Test specimen construction was verified by ICC NTA, LLC per the drawings included in this report. Any deviations are documented herein or on the drawings.

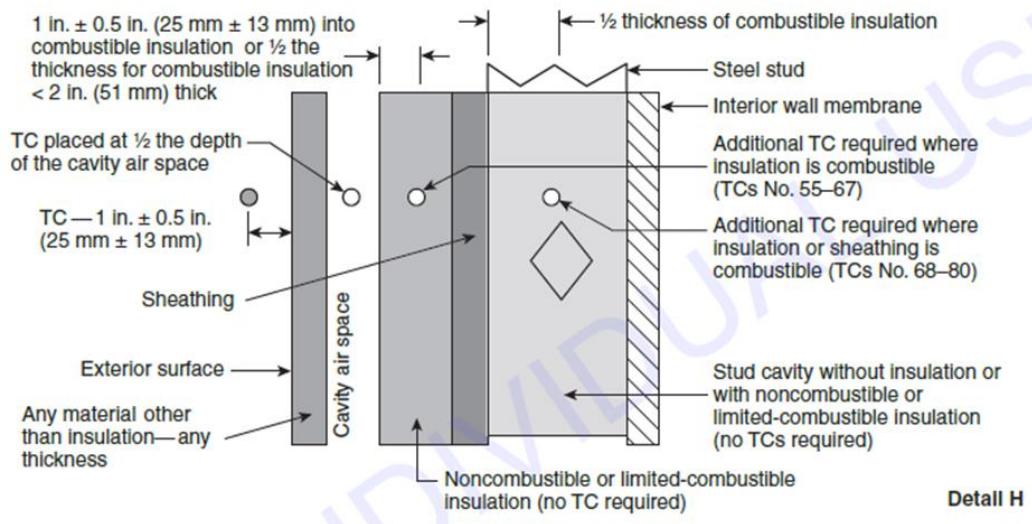

- Thermocouples — 1 in. (25 mm) from exterior wall surface
- Thermocouples — In the wall cavity air space or the insulation, or both, as shown in Figure 6.1(b) Details A through I.
- () Thermocouples — Additional thermocouples in the insulation or the stud cavity, or both, where required for the test specimen construction being tested, as shown in Figure 6.1(b) Details C through I.
